Jeremy Servoz Individual report:

My role in this project was the Design manager. I was assigned to create the design of the app and then to contribute to the coding mainly the search page.

I believe I fulfilled my role as the design manager, after the preliminary design created on paper and discussed with the project manager and the GUI Designer. I started designing the layout on paint however that proved very time consuming and frustrating, so I looked for an alternative to design the product on. The alternative was found with proto.io which is a simple app prototyping tool. After learning how the basics, I then created the design on proto.io trying to build it as closely as possible to the final product, including many of the the features of the app so that we could demonstrate an accurate representation of our final product in the tender presentation and for everyone in the group to have a good understand of the design and the interaction within the app.

After the tender presentation the design was mostly finished and I moved to the programming task. I struggled a bit with java and getting used to Android Studio. I think I could have done more programming wise, I completed the tasks I was assigned to but I didn't really go the extra mile outside of those. If I could do this project again, this definitely an area where I would try to do better and get involved more.

In both the tender and sales presentation, I helped the Multimedia and Content manager creating the scripts that he presented and helped with the demonstration during the tender presentation.

Finally, towards the end of the project, the group decided that the finance manager needed some help for the final financial deadlines. I volunteered to participate in the role of the Deputy/Assistant Financial Manager, taking care of making sure the timesheets where submitted on time and inputting the data from the timesheets to the analysis documents to be used in the financial deadlines.

Deliverables contributions:

- Quality Assurance manual:
  I wrote my part for the QA manual including what my role entails and the QA metrics for my role.
- Functional Specification:
  I wrote my part for the functional specification including a detailed section on the Design of the app and the purpose of each pages.
- Source code
  I contributed the layout of the search page and the togglable icons on the search page. I also worked closely with the QA manager in order to implement the search

algorithm created by the QA Manager within the search page and finally worked with the GUI Design manager on the settings page, the mute sounds and haptic feedback in particular.

- Design:
  I created the entirety of the design on proto.io and provided feedback for the creation of the icons. I created half of the recipe example and also half of the slideshow for the example recipes displayed on the app.

- HTML-tour of the product:
  I contributed to the design section of the HTML-tour.

- Finance:
  I contributed to the analysis document for the first financial report, and the entirety of the analysis document and follow up on the timesheets for the final financial report.

- Presentations:
  Worked on the script for the demonstration for both presentation.
